

HCL AppScan Standard

OVERVIEW

HCL AppScan Standard is a Dynamic Analysis testing tool designed for security experts and pen-testers to use when performing security tests on web applications and web services. It runs automatic scans that explore and test web applications, and includes one of the most powerful scanning engines in the world. Quickly triage and prioritize issues using the wealth of information provided, including test descriptions and vulnerabilities found. Issue remediation is easy using the advisories and fix recommendations for each issue detected. Testing your web applications before deployment and continuously assessing their risks in your production environment can help prevent expensive web application security breaches.

KEY CAPABILITIES

HCL AppScan Standard capabilities include:

- **Wide Security Coverage** – Scan and test for a wide range of web application security vulnerabilities
- **Advanced Scanning and Testing** – Employ the latest algorithms and techniques to ensure the most accurate explore coverage and testing
- **Quick Remediation** – Results are ordered by severity including detailed information on the issues found and their fix recommendation
- **Enhanced Insight** – Detailed reporting offers great flexibility for issue resolution and compliance management
